

SOLUTION BRIEF

Cost Optimization

AI-powered solutions to improve cloud resource efficiency and manage costs

Deliver highly available, reliable, and efficient services and applications

Hybrid Observability with deep insights into multi-cloud resource capacity and utilization helps ITOps and CloudOps teams optimize resources to scale AI projects, build workloads and applications, and deliver business services.

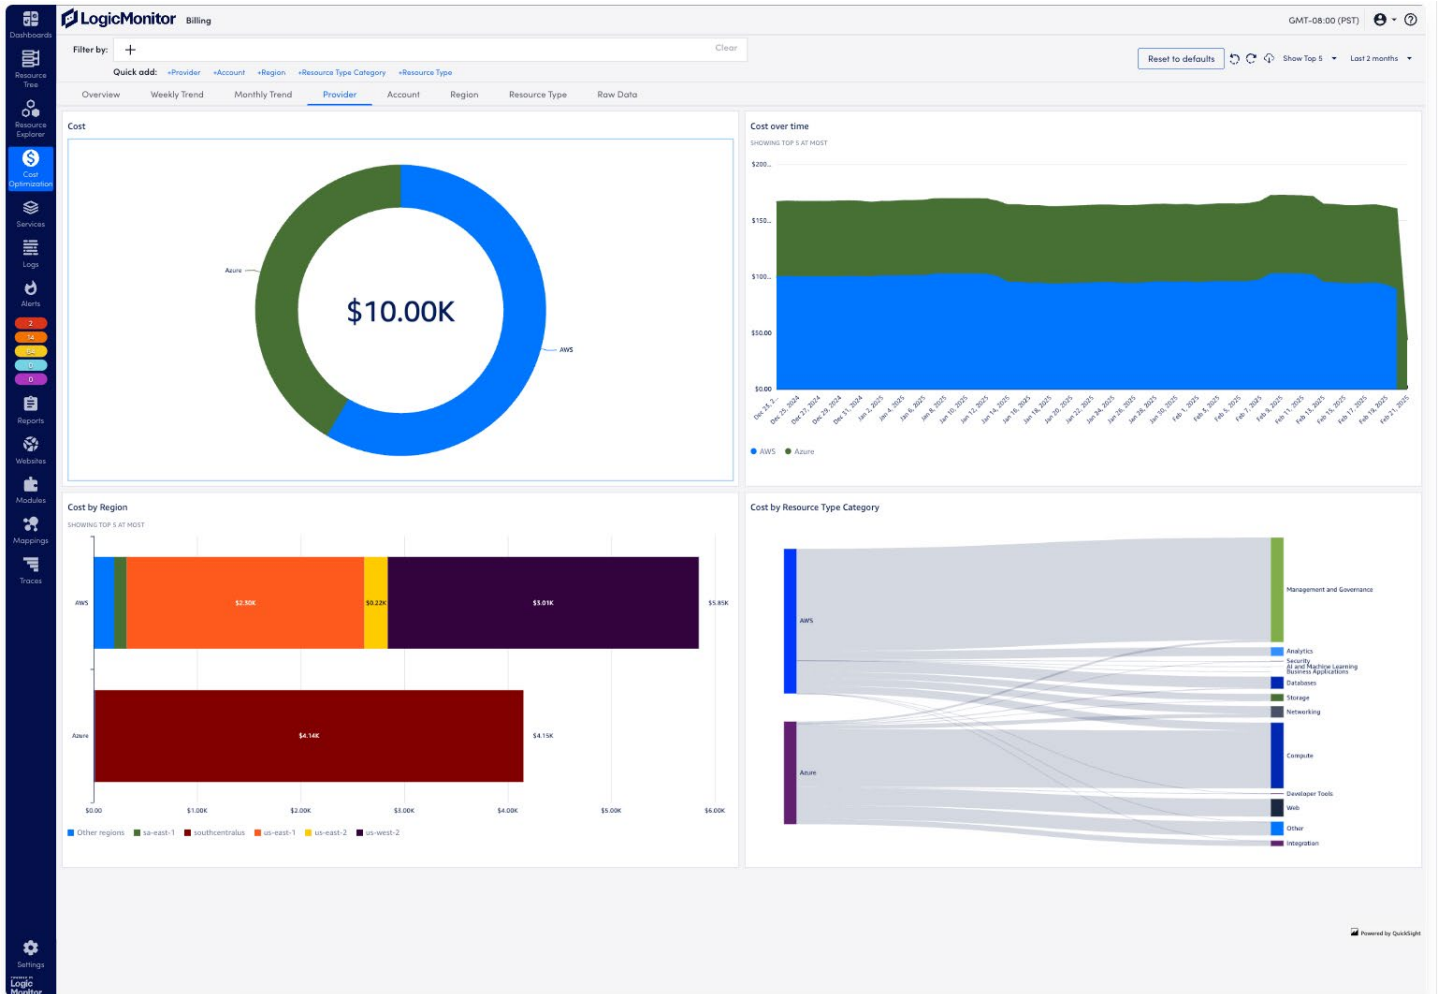

When adding cost control into Hybrid Observability, Ops teams can quickly remove excess cloud costs while maintaining optimal performance.

Part of LM Envision, the Hybrid Observability platform powered by AI, Cost Optimization helps teams rightsize cloud resources, gain predictability, and maintain optimal SLAs

BENEFITS

- Easily build a dashboard overview of multi-cloud billing and cost savings data to save money, optimize budgets, and track performance and cloud costs in the same view.
- Discover multi-cloud billing and cost allocation patterns. Get clear visibility into resource utilization over time to make better usage decisions for more efficient IT consumption.
- Adjust cloud resources to align with performance requirements to get the right mix for maintaining workloads and applications.

Multi-cloud billing visibility

WITH ZERO SETUP, WE USED THE NEW COST OPTIMIZATION FUNCTIONALITY IN OUR LOGICMONITOR ENVIRONMENT.

With zero setup, we used the new Cost Optimization functionality in our LogicMonitor environment. We started seeing both compute and storage recommendations that will result in substantial savings. Cost Optimization revealed several EC2 instances that were either not used anymore, or over-provisioned with clear evidence for deletion or downsizing. It also provided a list of unattached storage that we can immediately put into action.”

Randall Thomson,
VP Technical Operations, LogicMonitor

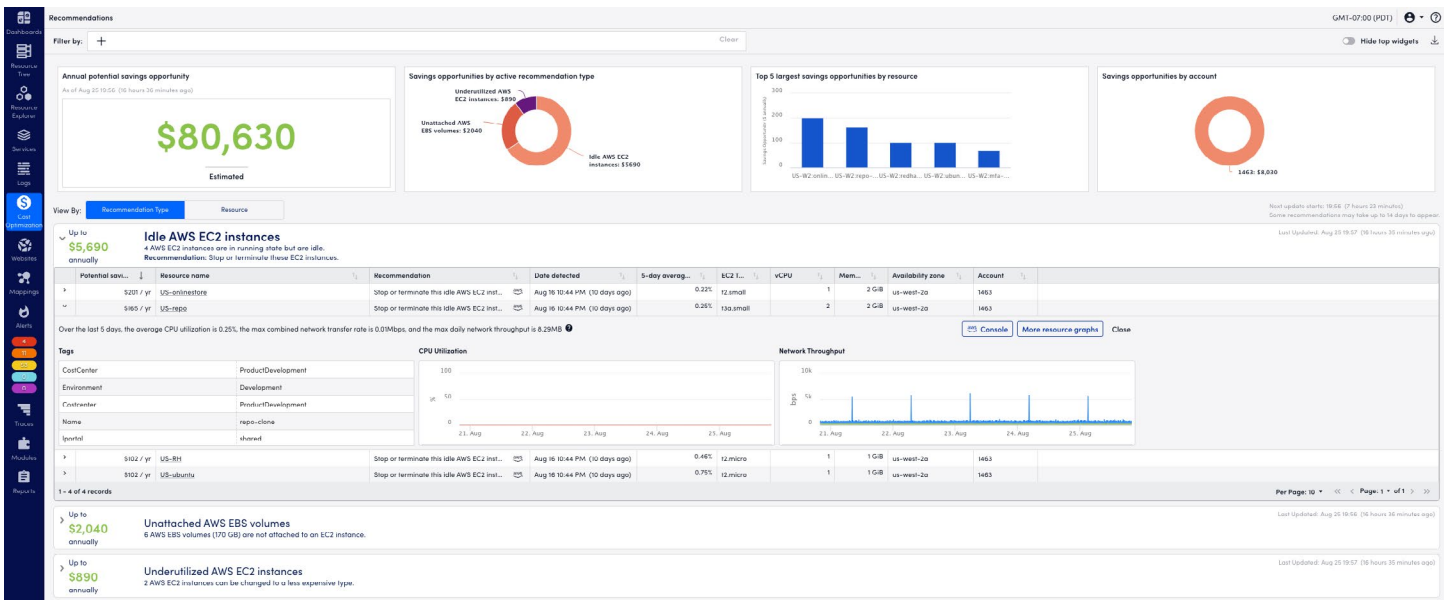

FEATURES

Billing (AWS, Azure, and GCP costs)

- Fully visualize the entirety of your multi-cloud spend in a single view by connecting LM Cost Optimization to your CSP-provided Cost data.
- Easily slice and dice cost data for deeper insights and trends into cloud bills.
- Filtered tags such as account, region, provider, resource type, and more to analyze the spend allocation and identify changes.

Cost Recommendations

- Powered by your existing performance data
- AI-powered cost-saving recommendations for efficient capacity and memory changes, removing idle resources, and more—while ensuring uninterrupted business performance.
- Includes criteria such as disk activity for detailed knowledge of resource consumption.
- Link to AWS and Azure portals to quickly modify resources based on recommendations.
- Available for AWS and Azure compute and storage resources, such as EC2 and Virtual Machines.

Proactive cost savings recommendations
